

AMENDMENTS TO THE CLAIMS

The following listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) In a fuel cell separator having a central part and an outer peripheral part, wherein multiple gas passages for guiding reaction gases and multiple reaction product passages for guiding a reaction product are provided by the outer peripheral part, the reaction gases being guided from the gas passages to the central part and reaction product produced at the central part being guided to the reaction product passages,

wherein the central part comprises a metal member, the peripheral part ~~comprises~~is a rubber member, and a projecting part surrounding the central part is formed integrally with the rubber member,

wherein an inner portion of the peripheral part overlays the central part,
said projecting part being provided by said inner portion of said peripheral part,
and an outer portion of the peripheral part extends away from the central part,
and the gas passages and reaction product passages are formed through said
outer portion.

2. (Previously Presented) The fuel cell separator according to claim 1, wherein the rubber member is made of silicone rubber.

3. (Currently Amended) A method for manufacturing a fuel cell separator, said fuel cell separator having a silicon rubber peripheral part and a metal central part, wherein multiple gas passages for guiding reaction gases and multiple reaction product passages for guiding a reaction product are provided by said peripheral part, reaction gases being guided from the gas passages to the metal central part and reaction product produced at the central part being guided to the reaction product passages, comprising the steps of:

disposing the metal central part in a cavity of an injection-molding mold;

maintaining an inside of the cavity at a low temperature so that silicone rubber does not reactively set and maintains a low viscosity;

injecting liquid silicone rubber into the cavity while said cavity is at the low temperature and guiding the liquid silicone rubber ~~to past~~ an edge part of the central part; and

forming the gas passages and the reaction product passages through the liquid silicone rubber that has been guided past the edge part of the central part; and

heating the inside of the cavity to reactively set the silicone rubber guided to the edge part of the central part.

4. (Currently Amended) A method for manufacturing a fuel cell separator, said fuel cell separator having a silicone rubber peripheral part and a metal central part, wherein multiple gas passages for guiding reaction gases and multiple reaction product passages for guiding a reaction product are

provided by the peripheral part, reaction gases being guided from the gas passages to the metal central part and reaction product produced at the central part being guided to the reaction product passages, comprising the steps of:

disposing the metal central part in a cavity of an injection-molding mold;

maintaining an inside of the cavity at a low temperature so that silicone rubber does not reactively set and maintains a low viscosity;

injecting liquid silicone rubber into the cavity while said cavity is at the low temperature and guiding the liquid ~~silicon~~silicone rubber to an edge part of the central part; and

heating the central part to reactively set the silicone rubber guided to the edge part of the central part.

5. (New) The fuel cell separator according to claim 1, wherein at least one support hole is defined through the central part adjacent to an edge of the central part, the support opening being filled by the rubber member so as to attach the rubber member to the central part.

6. (New) The fuel cell separator according to claim 5, wherein the rubber member is made of silicone rubber.

7. (New) The method for manufacturing the fuel cell separator according to claim 4, further comprising the steps of:

guiding the liquid silicone rubber over and past the edge of the central part such that the silicone rubber extends away from the central part; and forming the gas passages and the reaction product passages through the liquid silicone rubber at locations spaced from the central part.

8. (New) The method for manufacturing the fuel cell separator according to claim 3, further comprising the step of:
filling a hole defined through the central part with liquid silicone rubber, the hole being inwardly adjacent to the edge part of the central part, so as to positively interconnect the central part and the peripheral part.

9. (New) The method for manufacturing the fuel cell separator according to claim 4, further comprising the step of:
filling a hole defined through the central part with liquid silicone rubber, the hole being inwardly adjacent to the edge part of the central part, so as to positively interconnect the central part and the peripheral part.
